## CountFactors

Count factors of given number n.

START

Programming language: C++ ▼

A positive integer  $D$  is a *factor* of a positive integer  $N$  if there exists an integer  $M$  such that  $N = D * M$ .

For example, 6 is a factor of 24, because  $M = 4$  satisfies the above condition ( $24 = 6 * 4$ ).

Write a function:

```
int solution(int N);
```

that, given a positive integer  $N$ , returns the number of its factors.

For example, given  $N = 24$ , the function should return 8, because 24 has 8 factors, namely 1, 2, 3, 4, 6, 8, 12, 24. There are no other factors of 24.

Assume that:

- $N$  is an integer within the range  $[1..2,147,483,647]$ .

Complexity:

- expected worst-case time complexity is  $O(\sqrt{N})$ ;
- expected worst-case space complexity is  $O(1)$ .
